Hospital Analytics Dashboard

Project Overview

This project presents an interactive Hospital Analytics Dashboard developed using Microsoft Power BI. It consolidates large volumes of healthcare data into a single, unified platform, enabling healthcare professionals to monitor performance and identify trends at a glance.

The dashboard is designed to transform raw hospital data into actionable insights, empowering administrators and decision-makers to make informed, data-driven decisions. By visualizing key metrics clearly, it bridges the gap between complex data and strategic action.

Business Problem

Hospitals generate thousands of data points daily — yet most of this data remains unanalysed and underutilised. Without a structured analytics solution, tracking hospital performance, patient outcomes, and operational efficiency becomes extremely difficult.

Key Challenges:

- Massive volume of raw hospital data with no clear structure
- Difficulty monitoring admissions, costs, and treatment trends
- No unified view to support timely, data-driven decisions

Thank You!

The dashboard provides clear insights into hospital data and improves decision-making through data visualization.
